

ABSTRACT OF THE DISCLOSURE

A folding electronic device. The electronic device includes a body, an upper housing portion, a transmitting member, an elastic member, and a sliding member. The upper housing portion rotates between a closed position and an open position. The transmitting member rotates between a first position and a second position. The elastic member rotates the transmitting member to the second position. The sliding member rotates between a third position and a fourth position. When the sliding member is located at the third position, it is engaged with the transmitting member. When the sliding member is moved to the fourth position, it is disengaged from the transmitting member so that the upper housing portion rotates to the open position.
